

Breezely the Bear

Meet Breezely.
He is like any other bear.
He goes to the playground,
swims in the pool, rides his
scooter, goes to school, and
plays soccer on a team.

But, sometimes Breezely has a hard time breathing. He coughs, he wheezes, and it feels like there is heavy weight on his chest.

Breezely has asthma.
This means that the tubes that
put air into his lungs sometimes
get swollen and clogged.
And the air he needs to breathe
just doesn't get through.

Luckily, Breezely isn't alone.
Many other kids have
asthma too.

And there are things he can do
to keep his asthma in control.

First, Breezely must take his medicines. Asthma medicines are different than other types of medicines. They aren't like pills or cough syrup or shots. They are a magical mist that you inhale when you are having trouble breathing.

Bear can take his asthma medicine with a gizmo called an inhaler. An inhaler is connected to a spacer, that you then hold up to your face and take a deep breathe in.

Its like wearing a snorkel in the middle of a school of fish.

Or pretending you are an elephant with a long snout.

Pretty soon after inhaling the magical mist, Breezely starts to feel better and his lungs are happy.

Next Breezely needs to be a detective and collect clues about his asthma.
